

WaterLock 2 Consumables and Accessories

Protects your patient, protects your gas measurement systems. Designed to give you reliable gas measurements, the Dräger WaterLock 2 helps you to effectively filter humid and contaminated exhaled air thanks to our advanced membrane technology. Keeping your patients and investments safe from water, bacteria, and potential viruses.

Benefits

Deliver safe and precise gas measurement

When connecting patients to your anaesthesia or gas measurement device, you need to be reassured that your measurements are accurate. Moreover, controlling the likelihood of cross-contaminants is essential for your patient's wellbeing.

Engineered with two PTFE-membranes in combination with two self-sealing filters, our WaterLock 2 effectively separates condensed water and secretions that contain harmful contaminants, such as bacteria and viruses. As second protection system the WaterLock 2 comes with super absorbent polymer seals behind the PTFE membranes. In case of a fluid breakthrough these seals block the gas flow and protect the measuring unit against water (and contaminant) ingress — giving you more precise gas measurements as well as safeguarding your patient's health.

Safe and simple to handle

Maximise your workflow efficiency and improve your infection control protocols. Simply connect and operate, WaterLock 2's easy snap-lock connection makes it easy for you to install and empty. Using a 3-step process, all you need to do is:

- Hold WaterLock 2 at the grip and insert into your device until it audibly clicks
- Connect gas sample line to Luer port
- Extract water with a syringe

You can reliably use WaterLock for up to four weeks in your unit.

In combination with state-of-the-art PTFE membranes, you can effectively prevent water, bacteria, or viruses from entering your gas measurement system — keeping infections at bay.

Stable and secure: How WaterLock 2 works

Fitted with two hydrophobic microporous PTFE filters, WaterLock 2 provides your patient with optimum protection during therapy while ensuring accurate gas readings. This is achieved through a dual system that utilises self-sealing filters as second protection level. To begin, a sample of gas exhaled by the patient passes through the main hydrophobic membrane which filters both water and contaminants before it passes on through the module's sensors. The water is drawn into the water tank which can be emptied using a standard syringe. Optimised to ensure you a fast response and extremely effective drainage, our Dräger WaterLock 2 maintains a perfect capnogram even under extreme conditions, e.g. minimal-flow anaesthesia.

Reducing your costs

Your medical equipment is a valuable investment that helps you improve your patient outcomes and save lives. To support you in managing your costs of care, Dräger's WaterLock 2 has an operating life of four weeks, with immediate replacement, if necessary, when outstanding conditions occur. During this period, it can be emptied and reused as often as necessary, thanks to the possibility to remove water directly by using a standard syringe.
